Backend: .NET, C#, Entity Framework, Dapper, NHibernate, DDD, REST APIs, Quartz, xUnit.

Data: Oracle, PL/SQL, PostgreSQL, SQL Server.

Infrastructure: Kafka, SQS, Azure DevOps, Docker, CI/CD, Git, Grafana.

Front-end and mobile: Angular, TypeScript, Flutter, Dart.

Experience

Grupo Autoglass / Software Engineer

MAY 2024 – PRESENT, REMOTE

Enterprise logistics and distribution systems. Currently on ProductHub, the central catalog platform replacing the legacy system as the source of truth, kept in sync through Kafka.

- Product development Kanban board: designed and delivered the digital board that tracks 25,000+ products, replacing a spreadsheet five people maintained by hand. A .NET job (Quartz) holds the business rules, a materialized view feeds the Tableau dashboards, and the queries are optimized with CTEs.

- WMS, async slotting: automated slotting ran synchronously and blocked the operator for up to 5 minutes per item, in an operation handling thousands of products a day. Working with the business team, I found the step didn't need to be synchronous, since the item still waited on someone to physically put it away. I restructured the flow around a FIFO Kafka queue, keeping only the location lookup synchronous. The wait was gone for the operator.

- DRP, critical job optimization: the store replenishment job ran 45 minutes, 6 times a night. I rewrote the slowest stage's queries with CTEs and parallelized the processing that had no sequential dependency. Down to 30 minutes, roughly 550 hours a year.

- DRP, slow-moving stock transfers: worked on the feature that flags idle inventory and, instead of raising a new purchase order, triggers a transfer from the location holding it to the one that needs it.

Benner Sistemas / Software Engineer

OCTOBER 2022 – MAY 2024, HYBRID

- BL Mobile: built the app that digitized transport checklists, integrated directly with the core system. I worked on both the mobile app and the API. In use across several of the client's branches, issuing 5,000+ checklists a month.

- Tech lead for the squad, both for engineering and for the logistics domain. I reviewed the team's code and backed the other developers on technical decisions and on the product's business rules.

Benner Sistemas / Junior Software Engineer

MARCH 2022 – OCTOBER 2022, HYBRID

Features and improvements in the logistics product, reviewing the team's merge requests and refactoring critical paths for performance in routines running over large data volumes.

Benner Sistemas / Trainee Developer

JUNE 2021 – MARCH 2022, HYBRID

First contributions to the logistics product, working with TDD, SOLID and unit test coverage.

Projects

Aura / Barbershop scheduling and management app

LAUNCHED 2025 – LIVE

<https://aura.dispoapps.com.br/>

Published on the App Store and Google Play, in production since August 2025, with subscription plans and paying users. I built the whole app and most of the API. Financial module with per-barber commission, service packages, and self-service booking through a chatbot with WhatsApp confirmation.

Diffluent / Technical English writing practice

IN DEVELOPMENT

<https://diffluent.vercel.app/>

Practice platform that reviews your English the way a code review works, with a corpus tracking the mistakes you repeat. Built for people already working in tech who want to sound natural, not just be understood.

Education

UNINTER / Tecnólogo (3-year technology degree)

02/2022 – 03/2025, BLUMENAU, BRAZIL

Systems Analysis and Development.

SENAI/SC / Technical degree

2020 – 2021, BLUMENAU, BRAZIL

Systems Development
